To begin, make sure the component is turned on and a tape, CD, laserdisc, etc. is loa. Holding a Jewel Cube up to your ear provides convincing evidence that its lowerfrequency output is propagated via the port, while the highs emerge from the front of the cubes. The Lifestyle 20 includes essentially the same Acoustimass bass module that is familiar from other Bose systems, though its a bit larger and heavier than some of the earlier models. A chambered enclosure whose output emerges through an opening at one end, it is a black box that weighs in at a hefty 33 pounds and contains not only the bass speaker but also the amplifiers for the entire system which switch on automatically when a signal is applied and consume less than 2 watts in standby mode. The only external controls on the bass unit are treble and bass levelcontrol knobs, which offer a considerable range of adjustment. Each is centerdetented, and after confirming that the center settings provided the best overall sound balance in our room, we used them for our lab and listening tests.

The level of miniaturization and performance here is as amazing as in the tiny satellite speakers. Previous Lifestyle systems had similarappearing Music Centers, with tuners, CD players, and control functions, but Bose claims that this one has the worlds smallest sixdisc CD changer. Loading or removing discs is simple and foolproof. Like the main display, this control is a model of clarity, with crisp black letters and symbols on a white background. Most of the buttons on the remote are duplicated under the hinged front panel of the Music Center, where there are also a couple of buttons not found on the remote that are used to program the tuner presets. Although the lack of specs may disconcert audiophiles who get involved in the minutiae of their systems, it makes sense when a companys business is weighted toward nontechnical consumers. Our measurements confirmed that the tuner and CD sections of the Lifestyle 20 are well matched to the true needs of the market for which the system was designed. In other words, the figures we obtained reflect a system designed to be heard rather than judged primarily by its specifications or laboratory measurements. At 1 kHz the distortion remained between 79 dB and 81 dB about 0.01 percent over the full range of audible signal levels. The stereo channel separation remained close to 35 dB audibly sufficient for any musical program material over the full audio range, and the FM frequency response was rulerflat over the same range. The 50dB quieting sensitivity was 18 dBf, about average, and the AM sections response, typical of the genre, was down 6 dB at 40 Hz and 2.9 kHz. The sound never gave a clue to the size of the speakers in fact, the miniature cubes have a clear advantage over many larger speakers with respect to their imaging properties. Even though they were in plain view, there was no audible indication that they were the source of the sound.

The bass module, while a bit on the large side, never gave a hint of where its sound was coming from. At the opposite end of the room, about 15 feet from the Lifestyle satellite speakers, the soundpressure level regularly hit 100 dB and averaged in the mid90s. Even at that deafening level,

there were no obvious signs of overload, nor were the speakers damaged in any way. It will fit anywhere, it will not clash with any decor, and in my opinion it sounds at least as good as almost any conventional system in its price range, and a lot better than many. I realize there is a CD Changer Manual Release on the underside but can someone describe how to use it. There are two openings but it is not obvious how to release the cartridge. I have tried poking around with a small screwdriver but am afraid I will cause more damage. Shine a flashlight in and you'll see a U shaped cut out sheet metal on top of another piece of sheet metal. Stick a thin blade down against the U and pull away from the front CD door. I got my cd cassette out but the cd still won't load. Good luck with yours. You can go to www.AnyoneCanFixIt.com and see the electronics section regarding the Bose Lifestyle 20 Series. If

you cant get the CD magazine out by using the manual release on the bottom of the unit, the instructions will show you how to work around that too. If you can get the CD magazine out, you will most likely have the problem of the unit just buzzing, buzzing, buzzing, and not able to load a CD to play. The instructions will show you how to fix that. I manage to solve my magazine release problem thanks to Claudio Fassardi. I think the cause of the sticking was a thicker CD, its in the recycle bin already. Unfortunately before having read his post I tried blindly to work the CD Changer Manual Release and so I released one of the 4 springs mentioned by others. Anyway Im listening to my CDs once again and it didnt cost the crazy fees Bose charges. I got the CD Changer out. My daughter had put the CDs in upside down. However, when I righted them, it still wont play.

Is there a reset Im sorry, and this wont be very useful, but Ive never heard of a CD player that locks up when you put a CD in upside down. Just brutal. I am not a happy Lifestyle 20 owner, though. A much more serious problem has occurred as I switch on power a low tone noise appears and its there all the time unless you increase the volume in order to hide it. I havent taken the whole set to the Bose assistance for the reasons we all know to much time and money. Has anyone have this problem before Hopefully you have an external device that was recently added or some motor plugged into the same AC circuit that could explain the problem. Probably not but you never know! I used the manual eject slot on the bottom of the Music Center, following instructions I learned here, and inserted a long slim jewelery tool, and freed it. That solved the humming problem. Thanks to all who take the time to record their experience and knowledge here. Post Number 1 Registered May10 CD magazine was stuck in my Lifestyle 20. I managed to get it out. However, it will even get stuck and make the same noise for an empty magazine. So I am suspecting a CD may be stuck inside or something is messed up inside. Thoughts Advice There are a couple things to keep in mind. If your player seems stuck and makes a humming sound, there are two motors in the unit. The nylon gears after time will split causing the shaft to turn inside the gear. After removing the CD carriage turn it upside down and with the ribbon cable still connected you will see the two motors and hear the motor turning. Most of the time itll be the smaller motor gear that goes bad. If you care to repair it yourself youll theres a way around it. The shaft is highly polished. I removed the gear and took a small rattail file and ran it length wise along the shaft to roughen it up and then used some epoxy, not crazy glue and attached the gear to the shaft. Wait at least two days for it to dry. That should do the trick. Here are some tips.

I suggest people to try my method first and fall back to taking the main unit apart if my method does not do the trick. My CD cassette would not eject. At this point I could see the worm gear and the black rollers. With power reconnected and fiddling with the Next Disc button, the 2 black rollers then moved so I could no longer see the nylon gears. I put 2 discs in the cassette, in the top 2 slots slots 5 and 6 and put the cassette back in the main unit. Repeat the process of using the Next Disc button, and as soon as the the CD came out of the player, back into cassette slot 6, I detached the power. Use the Manual Eject slot to get the cassette out again. The gears will be visible and the 2 black rollers out of the way, at the top. This is the drive gear for the worm gear you will see. Link to photo at the end of this post. Im listening to a CD as I write this. Lets hope the gear is not cracked and that this fix does the trick. I did not use glue, so I may have to repeat this process some day, but at least the player is working now. Maybe Ill go back and add a dab of glue, accessing the gear the same way. About 20 years after their manufacture dates, these units have two common issues dim to dead display and faulty CD changer. Swapping 5 capacitors fixes the display issue but fixing the CD changer has befuddled me. So, inspired by some clever eBay sellers who had already capitalized on the idea, I installed a Bluetooth receiver in place of the CD changer.

I didnt purchase and reverse engineer their designs, but it may have been a better use of time had I done so. This draws very little current, especially when idle. So, after changing sources away from CD and navigating back to CD, audio will not play until the device is powered on and off. If someone else has more hardware aptitude, Im sure theres a way to overcome these issues. With the proper hardware, we could actually make the media controls work with Bluetooth! A good BT receiver This

way you'll have a self-contained BT unit that doesn't require a restart everytime you want to listen to BT. Removing the CD player will obviously fix this issue. There's almost certainly a way to configure the circuit without introducing a ground loop, but I'm not much of a circuits guy. Your feedback is welcome. I haven't tested this. Covered in the first half of this video So, you should have a long strand of wires with a connector at the end. There should be a red for right audio channel, white for left audio channel, and a shared ground wire. There will be a few wires, only strip the red positive, black negative wires. This can be tested by plugging the full USB end into a USB power brick and testing the voltage with a multimeter or through trial and error, reversing the polarity probably won't break anything. The input positive power purple goes from the Bose to the pin marked ST. The ground is the middle pin. The negative is the far right pin. Turn on the Lifestyle 20 and navigate to CD.
